The diagram shows the following components:

- Vector**: Represented by two parallel horizontal lines.
- Dynamic Array**: Represented by two curved lines.
- EXIT**: A label above two parallel arrows pointing right.
- Change size**: A label at the end of a curved arrow pointing right.

A curved arrow connects the **Vector** and **Dynamic Array** labels to the **EXIT** label. Another curved arrow originates from the **Dynamic Array** label and points to the **Change size** label.

`vector <datatype> name;`

```
vector <int> vec;  
size → "name · size ()"
```

```
#include<iostream> //Header File
#include<bits/stdc++.h>
using namespace std;
int main(){ //Start of the main function
    vector<int> vec={2,6,4};
    cout<<"Size = "<<vec.size()<<endl;
    for(int i=0;i<vec.size();i++){
        cout<<vec[i]<<" ";
    }
    cout<<endl;
    vec.push_back(9); //Adds an element at the end
    cout<<"Size = "<<vec.size()<<endl;
    for(int i=0;i<vec.size();i++){
        cout<<vec[i]<<" ";
    }
    cout<<endl;
    vec.insert(vec.begin()+1,10); //Insert 10 at index 1
    cout<<"Size = "<<vec.size()<<endl;
    for(int i=0;i<vec.size();i++){
        cout<<vec[i]<<" ";
    }
    cout<<endl;
    vec.pop_back(); //Removes the last element
    cout<<"Size = "<<vec.size()<<endl;
    for(int i=0;i<vec.size();i++){
        cout<<vec[i]<<" ";
    }
    cout<<endl;
    vec.erase(vec.begin()+2);
}
```

```
cout<<"Size = "<<vec.size()<<endl;
for(int i=0;i<vec.size();i++){
    cout<<vec[i]<<" ";
}
cout<<endl;
```

Size

vec.size()

Insertion:

① push-back (ele)

→ rec.push-back(5);  
→ Insert 5 at the end.

② insert (index, ele)

→ rec.insert (rec.begin() + 1, 4);  
→ Insert 4 at index 1.

Deletion:

① pop-back()

→ rec.pop-back();  
→ Remove last element

② erase (index)

→ rec.erase (rec.begin() + 2)  
→ Remove element at index 2.
